Microprojects are small actions in the form of Nature-Based Solutions (NBS) that aim to improve the environment and the community in which we live; these actions can benefit both the natural environment and society.

1. Promote the development and implementation of projects for the conservation and restoration of the natural environment, which at the same time help to encourage wonder, curiosity, research, and experimentation as an essential part of the educational process and personal and social growth. 2. Financially support actions aimed at eco-social educational transformation by implementing nature-based projects (SBN), by the Sustainable Development Goals of the 2030 Agenda. 3. Promote learning environments that favor changes in the organizational culture of the center, transdisciplinarity, teamwork, and transversality of the learning and teaching process. 4. Promote actions that favor the application of active methodologies that contribute to change in teaching practices and promote the development of students' key competencies from the eco-social dimension.

Recording of the program highlighting the most important aspects of the project.

Group of teachers and students from an educational institution in Andalusia.
